

Screen Recording 2026-04-23 091736.mp4

Meeting Date : 18/7/2026, 10:58:44 pm

Duration : 5 minutes

Language : English

AI Model : gemma2:2b

Executive Summary

The meeting discussed various machine learning techniques and algorithms, including SVM, lasso regression, k-means clustering, and maximum likelihood functions. Participants reviewed the theoretical concepts behind these methods, such as information gain, bias-variance tradeoff, evaluation metrics (MSE, ME, R-squared), and different types of overfitting and underfitting. The meeting also focused on practical applications, including algorithm selection based on sample data and understanding the concept of maximum likelihood functions.

Action Items

1. Review the provided materials for the machine learning techniques discussed in the meeting.

Assignee : Anikar

Priority : High

Next Steps

- Continue working on the paper based on the concepts discussed in the meeting. Ensure clarity and simplicity in writing.

Meeting Metrics

Total Words : 519

Reading Time : 1 minute(s)

Engagement Score : 65%

Meeting Efficiency : 52%

Processing Time : 0 sec

AI Model : gemma2:2b

Meeting Transcript

Optimal hyperplane represent carisa by using a SVM algorithm, ok. So, it is information gain SVM is important point. Then the unit number 3, again you can have the variations in the regression. Rich lasso comparative analysis, you should be able to understand overfitting and underfitting. So, if it is overfitting, what type of precautions you need to consider, what are the different cost functions? It is a glomatipai jakumala, MSE, ME, MA, which happened a regression model, evaluate kurtate, evaluation parameters, kaiya slippai jai, it is formula, ok. Sometimes the question will be comes in a theoretical pattern define the cost function, right. And again, what do you mean by bias variance or what are the different types of evaluation pattern, precision recall, confusion matrix kaiya slippai examples. So, if we go see that the equation that you are a representation k love in the faji, ok. The region lasso comparison, then evaluation pattern for the MSE, ME, R, square over A, and the overfitting and underfitting decision recall. He is of course, grew up in Bhagit Linda, he, ok. So, little bit theoretical questions will be there, right, earning unit number 4, Madhyapur, he, Bhagit Lotto, he means considering algorithm that, take examples, kittumala center points in the routine, and take over to melodic calculate correspondence and then you will get the better cluster formation, right. A priori algorithm class, Madipanapun bokkilata, a priori algorithm, manjay, total number of directions delayed, that minimum support kitti, minimum confidence kitti, ahi, the algorithms, ok. K means k medoid, examples, you should talk, mukta, k medoid, nya silta, tatsam, medoids, the lighting, d1, c1, kai 3, aso, ok. A priori algorithm, minimum support and a minimum confidence value delay, and itumala t is systematic step by step, step sla marking ahi, patsmarka, hette veh was t3 presentation, nus the final answer delay, tzal nah nahul, ok. Then you have to consider the maximum likelihood functions, kutliya het, binomial representation, ok. If you have sample random samples, and you need to find out the maximum likelihood functions, take xi binomia lahi, and in kahitumi patterns of kutai, and that you exponential values conflict, ahi, ashapadhi tina tumala, explore karecha het, ok. Clear with this, yes, upon hetse re content, kutliya het. The tamoy, in the jub, in mediodus and itula hette odho, nus the labus to med or as a moltiva, kutai kusht, veh was tipagha, all the material is already available with you. You can clear the concept, you can solve the different examples, and try to understand the concept, write the paper in a readable format, means malato paper and then write the paper in a simple way. So, you can write the paper in a simple way, and then write the paper in a simple way, and then write the paper in a simple way, and then, write the paper in a simple way, and then write the paper in a simple way, and then write this, anything from your side, any confusion, any query for us, nayakavaras, yes, I am not able to hear. Anish, Durbesh, Anikar.
